SPORTS ANALYTICS | DATA ANALYST

End-to-end sports data analyst specializing in predictive modeling and reporting infrastructure for coaching staffs and front offices. Proven track record of turning complex database queries into actionable insights, from engineering Wake Forest's automated pregame scouting system to building a Bayesian ERA projection model that outperforms traditional metrics like FIP. Proficient in SQL, R, and Python, with a strong ability to translate data into strategic decisions for coaches and executives.

EDUCATION

Wake Forest University School of Business, Winston-Salem, NC
Master of Science in Business Analytics, *May 2027*
Bachelor of Science in Mathematical Business, Minors in Entrepreneurship and Statistics, *May 2026*, GPA 3.807

AREAS OF EXPERTISE

Statistical Modeling | Predictive Analytics | Bayesian Inference | Data Pipelines | Reporting Automation | Eloquence | Creative Thinker
Sports Analytics | Player Evaluation | Data Visualization | Monte Carlo Simulation | Clustering | Experimental Design | Adaptability
Team Leadership | Stakeholder Communication | Translating Analysis to Non-Technical Audiences | Problem-Solving | Goal Oriented

TECHNICAL SKILLS

Programming Languages: R, SQL, Python
Predictive Modeling & Statistical Analysis: Linear and Logistic Regression, Gamma Regression, Bayesian Hierarchical Models (JAGS), Bayesian Shrinkage, Monte Carlo Simulation, Hypothesis Testing, Cross-Validation
Machine Learning: Random Forest, XGBoost, K-Nearest Neighbors, K-Means and Hierarchical Clustering, Segmentation Modeling
R Ecosystem: tidyverse, gt, ggplot2, Shiny, R Markdown, DBI/RPostgres
Databases & Analytical Tools: PostgreSQL, Snowflake, Tableau, Git, Excel, PowerPoint

PROFESSIONAL EXPERIENCE

SCOUTING COORDINATOR | **Wake Forest Baseball Analytics |** Winston-Salem, NC *December 2023 – Present*

- Lead a team of 8 student analysts producing opponent scouting reports for the coaching staff, translating coaches' questions into statistical analyses and presenting findings to staff with varying quantitative backgrounds.
- Engineered an automated scouting report system using R and SQL (PostgreSQL) to convert opponent tendency data into repeatable pregame PDF deliverables.
- Developed clustering models in R that group pitchers by pitch shape, producing matchup tables the staff uses to set lineups and pitching matchups against specific opponents.

NASCAR ANALYTICS INTERN | **Active Decision Support |** Washington, D.C. *April 2025 – September 2025*

- Created a driver performance evaluation system using custom metrics and machine learning models to predict race outcomes and identify over/underperformers by track type.
- Devised visuals and driver leaderboards in R Markdown, gt, and ggplot2, surfacing performance trends across races and seasons for a non-technical audience.

DATA SCIENCE INTERN | **Tenable, Inc. |** Dublin, Ireland *June 2024 – August 2024*

- Completed a customer segmentation project using SQL to pull product and customer data from Snowflake, then built the segmentation model in Python on license usage, scan frequency, and scan size.
- Designed a Tableau dashboard, still in use today, to summarize the findings, and demoed it to over 50 data scientists, data engineers, and customer success managers.
- Used the model to identify upsell opportunities and delivered the 400 strongest candidates to the sales team as leads.

ANALYTICAL PROJECT EXPERIENCE

Deacon Independent Pitching (DIP), Bayesian ERA Projection: Coded a Bayesian hierarchical model in R that projects next-season ERA from pitcher-level inputs using normal likelihoods, prior distributions, and partial pooling by conference. Correlates 0.402 with next-season ERA against 0.290 for ERA and 0.315 for cFIP, outperforming both on the pitching coach's stated 0.40 threshold. In use by the Wake Forest pitching staff.

NBA Win Prediction with the Four Factors: Modeled team and opponent Four Factors (eFG%, TOV%, OREB%, FTA rate) across 10,780 NBA games from 2017 to 2022 in R, comparing logistic regression, KNN, and random forest under 10-fold cross-validation. Shooting and opponent shooting dominated win probability, turnovers ranked second, and free throw rate mattered least.

The Trade Web, MLB Transaction Visualization: Engineered and deployed a full-stack data visualization platform using AI-assisted development tools to ingest 2,393 MLB trades (5,667 assets) via Node.js and the MLB Stats API; architected an interactive D3 front end tracking club networks and player timelines.
